The multiple polynomial classification equation that was used as a reference to create the databases labeled as “the multiple polynomial classification equation systems” is the following:

$$y \in \begin{cases} 1 & \text{if } b_0 + b_1x_1 + b_2x_1^2 + b_3x_2 + b_4x_2^2 < 30 \\ 0 & \text{if } b_0 + b_1x_1 + b_2x_1^2 + b_3x_2 + b_4x_2^2 \geq 30 \end{cases} \quad (1)$$

Where  $y$  is the dependent variable (output of the current sample);  $x_1, x_2$  represents the independent variables (inputs of the current sample); and  $b_0, b_1, b_2, b_3, b_4$  stand for the coefficient values of the equation. Furthermore, the values that were selected for  $b_0, b_1, b_2, b_3, b_4$  are the following:

- $b_0 = 82$
- $b_1 = -1.6$
- $b_2 = 0.016$
- $b_3 = -1.28$
- $b_4 = 0.0128$

such that the Eq. (1) will turn into the following:

$$y \in \begin{cases} 1 & \text{if } 82 - (1.6)x_1 + (0.016)x_1^2 - (1.28)x_2 + (0.0128)x_2^2 < 30 \\ 0 & \text{if } 82 - (1.6)x_1 + (0.016)x_1^2 - (1.28)x_2 + (0.0128)x_2^2 \geq 30 \end{cases} \quad (2)$$

However, the Eq. (2) was modified by adding to it a bias component  $r$ , that would represent a random value and should be generated each time a new sample is calculated:

$$y \in \begin{cases} 1 & \text{if } 82 - (1.6)x_1 + (0.016)x_1^2 - (1.28)x_2 + (0.0128)x_2^2 + r < 30 \\ 0 & \text{if } 82 - (1.6)x_1 + (0.016)x_1^2 - (1.28)x_2 + (0.0128)x_2^2 + r \geq 30 \end{cases} \quad | \quad -10 \leq r \leq 10 \quad (3)$$

Where the independent variable was restricted to be sampled with values according to the following way  $0 < x \leq 100$ .

Nevertheless, several regression databases governed by the term  $82 - (1.6)x_1 + (0.016)x_1^2 - (1.28)x_2 + (0.0128)x_2^2 + r$  from the Eq. (3) have already been created (see databases in the directory databases/regressionDBs/multiplePolynomialEquationSystem).

Therefore, it was decided to recycle them and use a copy of those files in Excel to apply to them the threshold defined in the Eq. (3), which is 30. As a consequence, the following .csv (comma delimited) files were generated for the creation of the multiple linear classification equation systems:

- polynomialClassificationSystem\_1systems\_10samplesPerSys.csv
- polynomialClassificationSystem\_10systems\_10samplesPerSys.csv
- polynomialClassificationSystem\_10systems\_100samplesPerSys.csv
- polynomialClassificationSystem\_100systems\_100samplesPerSys.csv
- polynomialClassificationSystem\_100systems\_1000samplesPerSys.csv
- polynomialClassificationSystem\_1000systems\_1000samplesPerSys.csv

For all these files, note that they try to mimic how a real database would normally be organized by a professional and in which you will encounter four columns, whose headers and purpose are the following:

1. **id:** Represents the unique identifier for the current row of the database.
2. **system\_id:** Represents the unique identifier for the current system sampled. This is because the databases will contemplate having several samples for several systems that manifest the same phenomenon.
3. **dependent\_variable:** Represents the output value of the current sample.
4. **independent\_variable\_1:** Represents the input value 1 that generated the current sample.
5. **independent\_variable\_2:** Represents the input value 2 that generated the current sample.

**Created in:** September 21, 2021.

**Last update in:** None.
